

# DATA CONVERSION/MIGRATION

## Data Conversion/Migration:

When migrating patient and blood product history to a new information system, it's important that no critical data gets left behind. Our experienced migration specialists can help extract historical data from the legacy database or create a new archive database. Additionally our specialists can help with the design and build of your new system's infrastructure. Working in products like Cerner Millennium PathNet, Medidata HCLL Client/Server, and Sunquest laboratory, we create translation tables to convert patient history and blood product history to your new target system while meeting the specific system design needs that you require.

- Patient history conversions may include: Demographics, blood typing and general testing results, antibodies, antigens, problems, comments and transfusion requirements. Donor modules can also be included when necessary.
- Blood product history conversions may include: Source and inventory details, product testing results, antibodies, antigens, product comments and transfusion history. Supplied and manufactured products can be exported along with their transaction and final disposition history. Auxiliary data streams can be created to maintain the relationships between pooled, derivative and original units.

The process of Data Conversion is customized to the needs of your facility. Please give us a call or send an email with the specifics of your project and we would be happy to provide a quote that provides just what you need for a successful transition.
